

UBC Transit Demand Analysis

Transit demand vs. bus supply at the University of British Columbia — powered by Rogers cell-tower connection data and TransLink TSPR performance indicators.

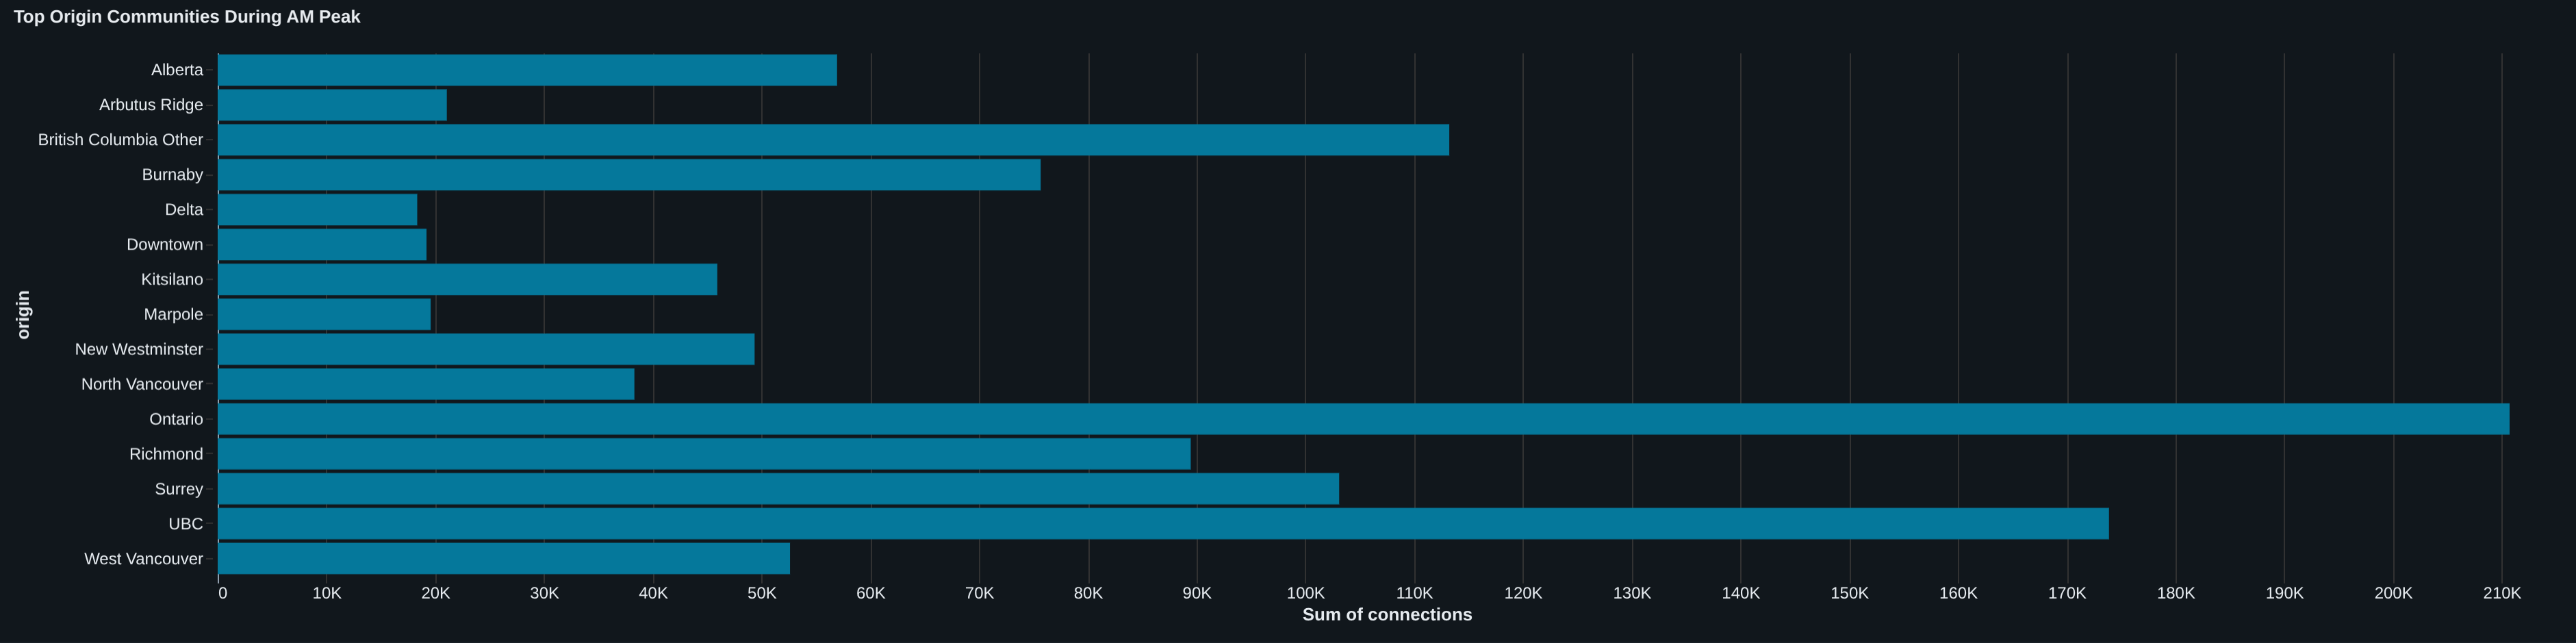

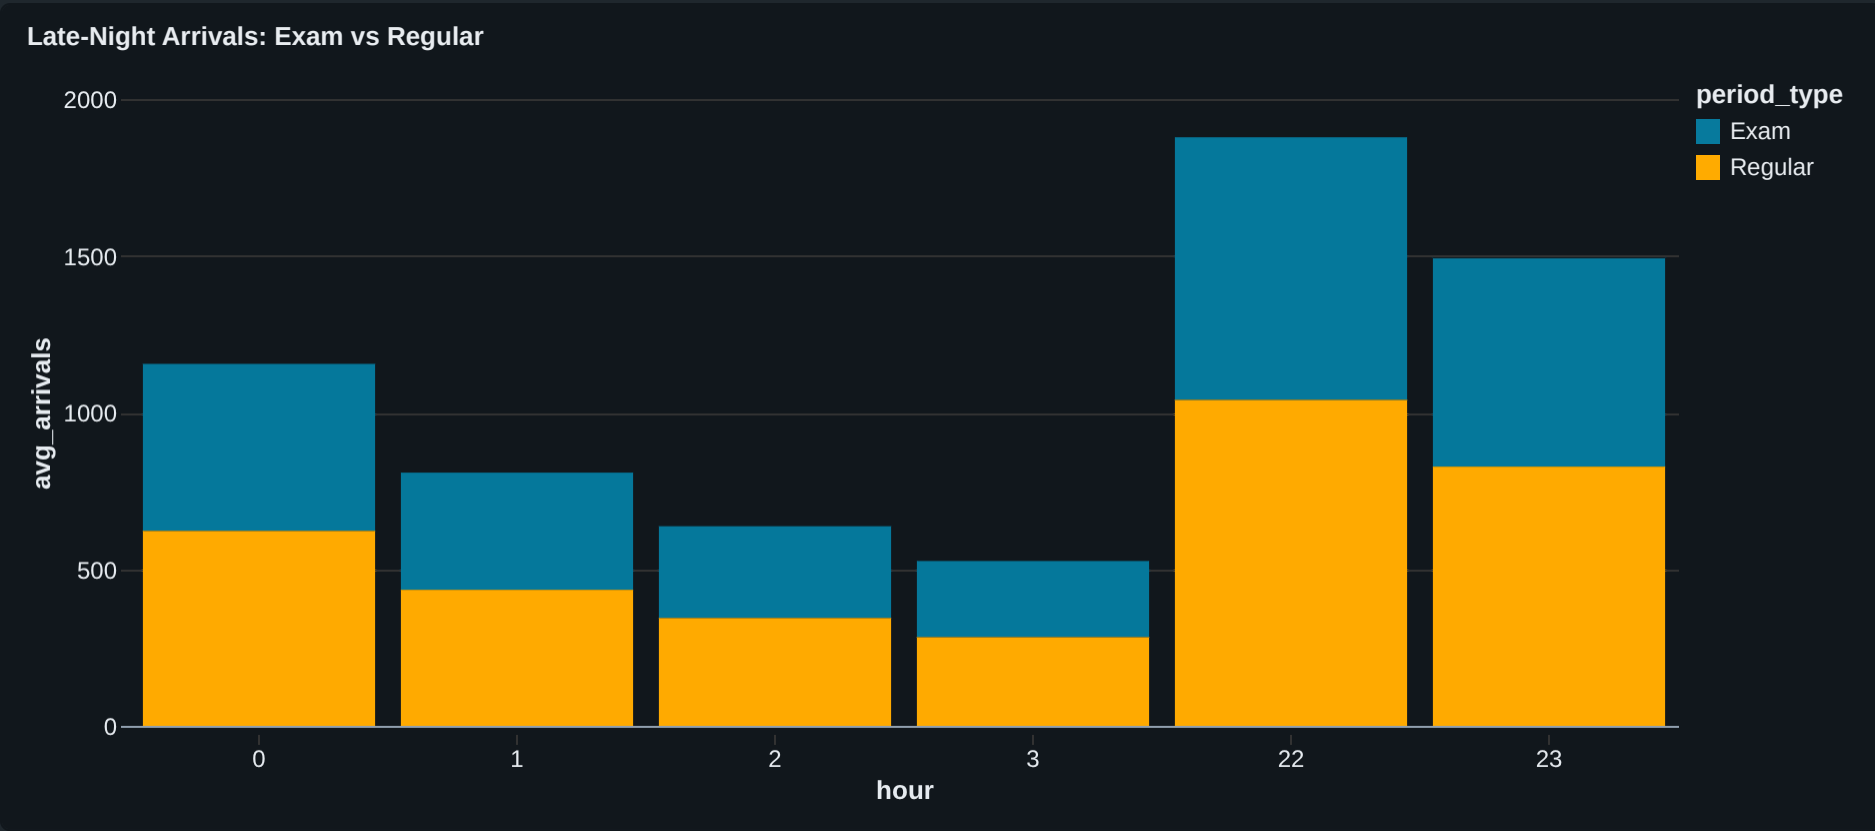

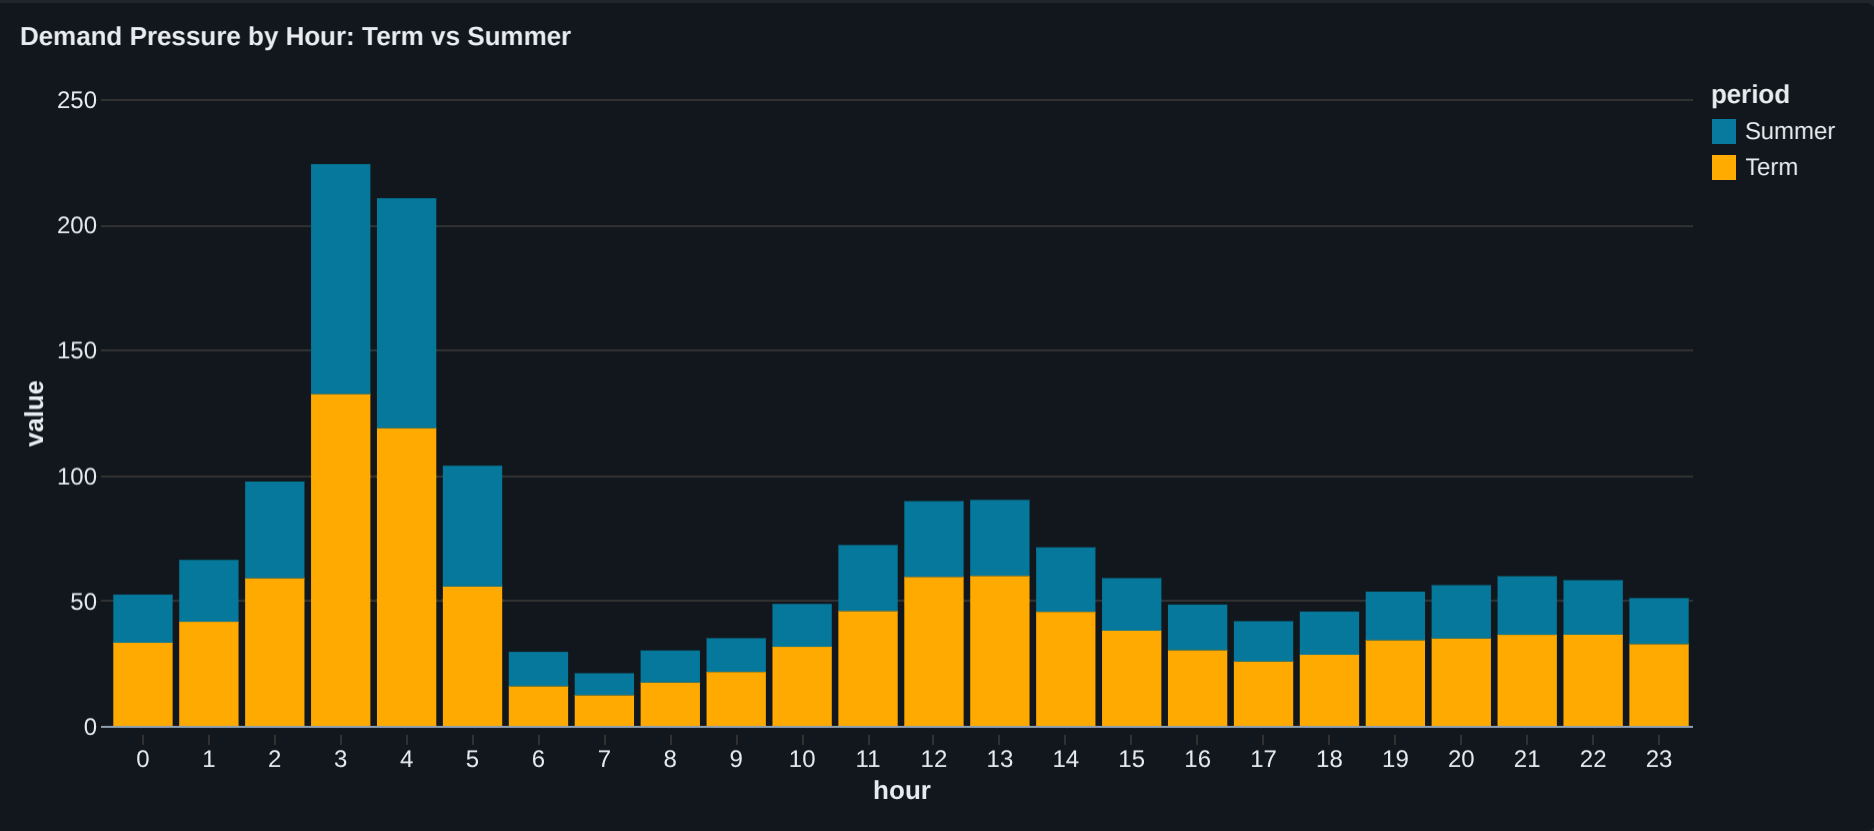

Total Weekday Arrivals	Avg Arrivals / Bus (Term)	Routes >10% Overcrowded	Rain Demand Increase %
6.1M	43.52	4	22

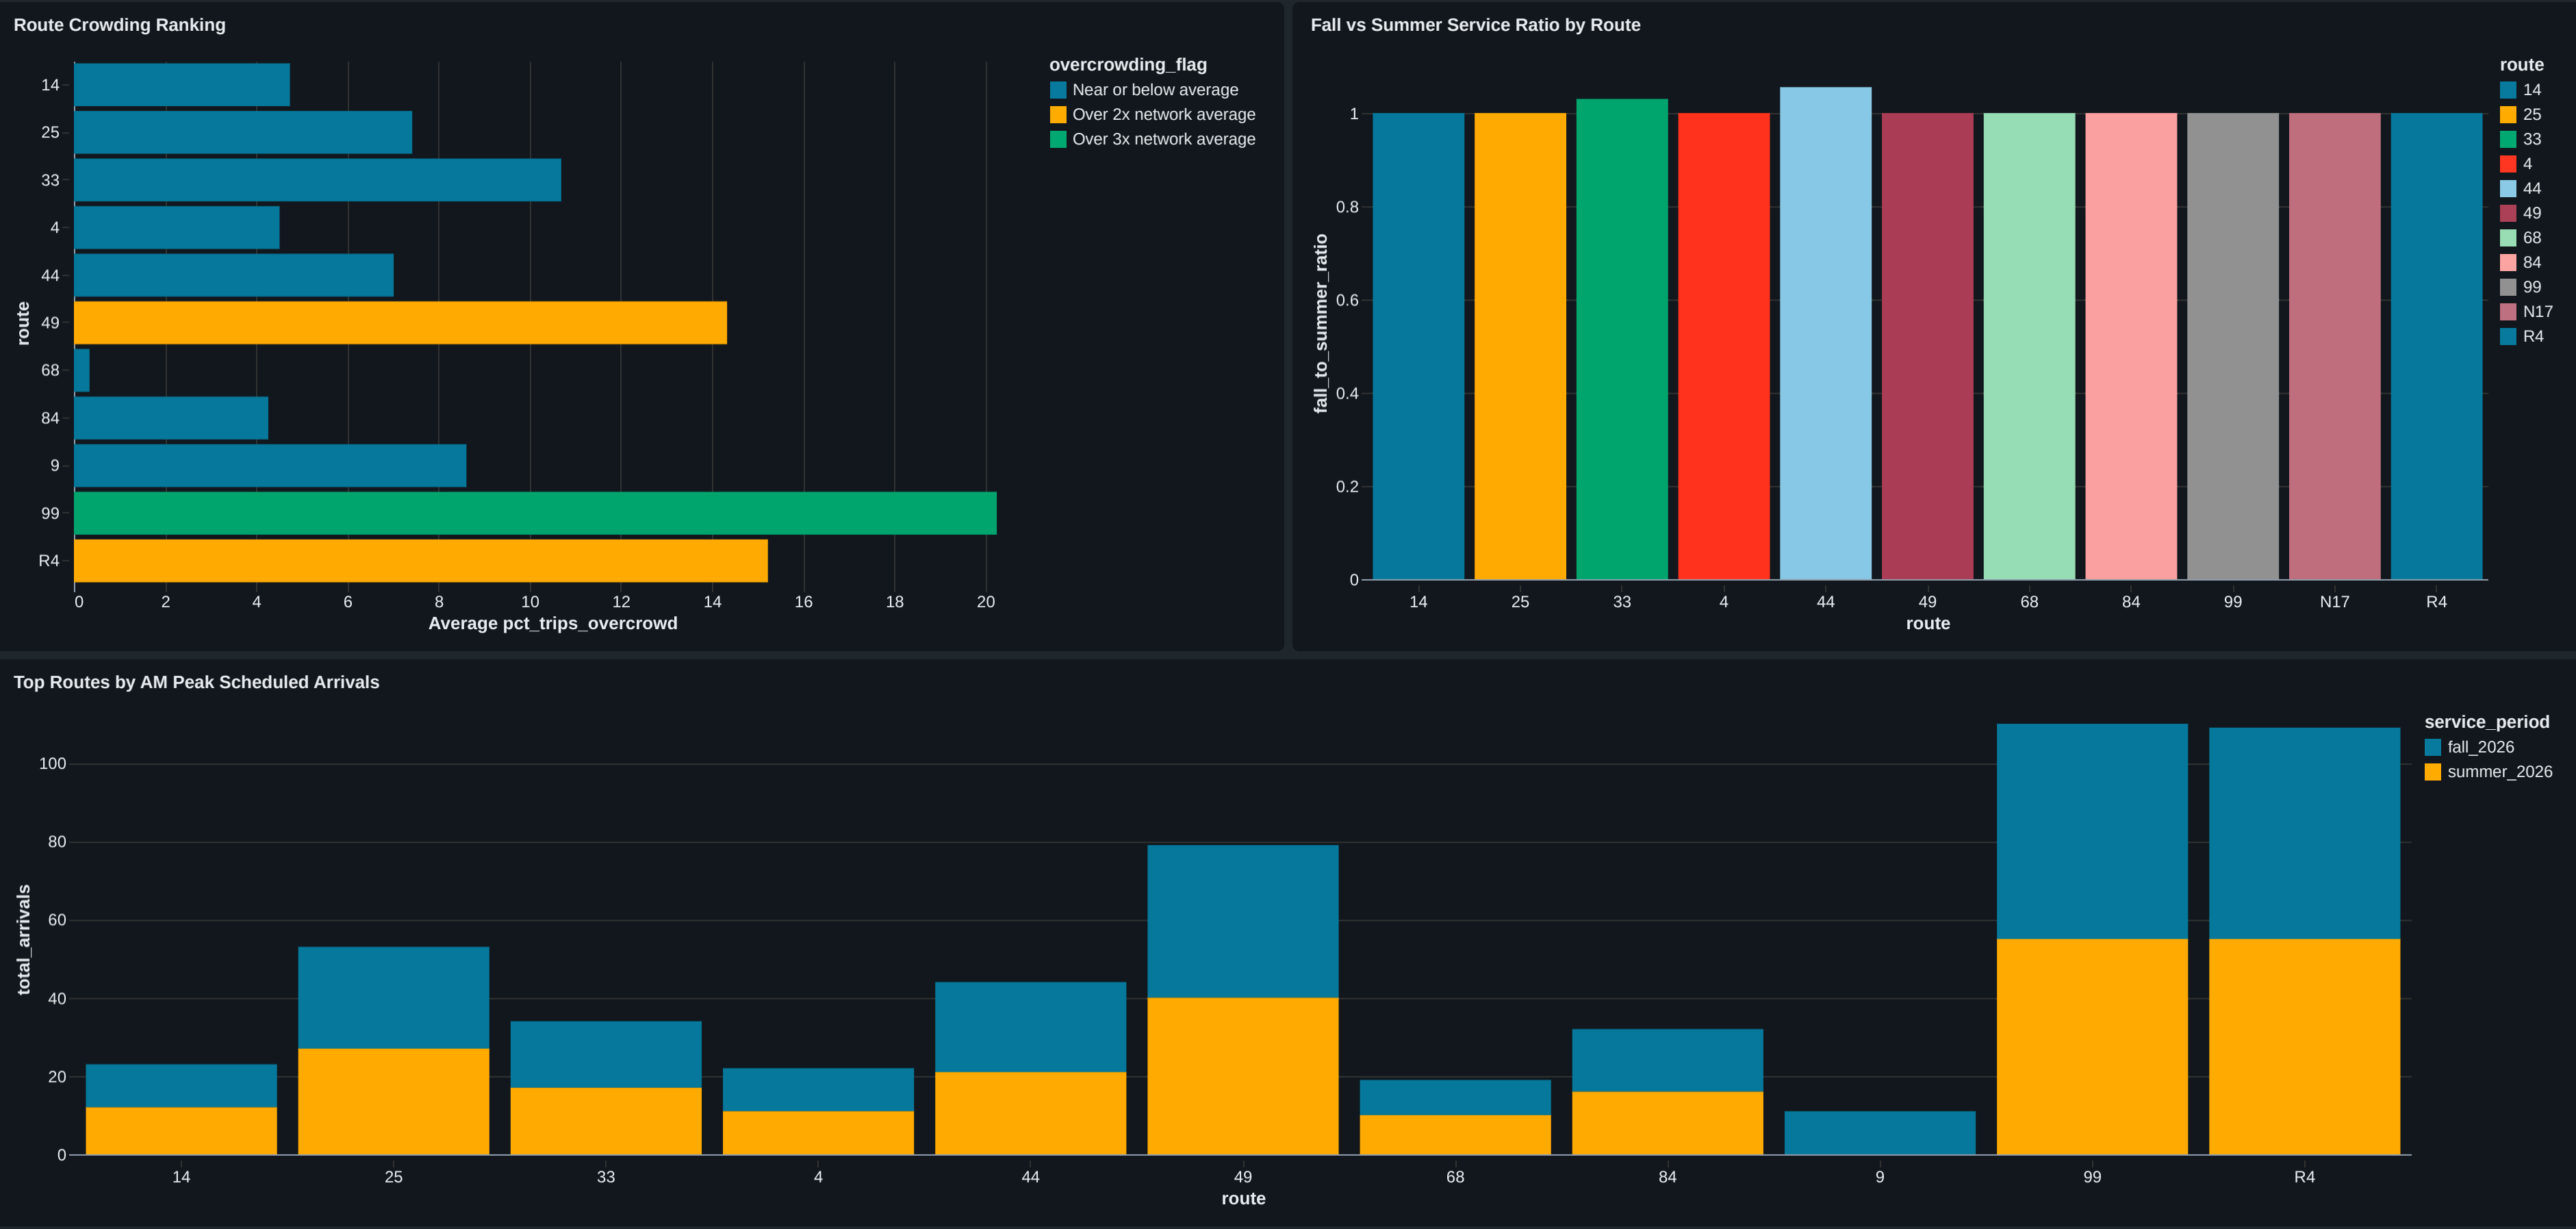

Methodology Caveats

- Bus supply is flat within each service period by construction — one schedule proxy per period. Month-to-month bus count differences within fall_2026 or summer_2026 are not real service changes.
- arrivals_per_scheduled_bus is a demand-timing index, not a crowding measure. For crowding, use TSPR Perc_Trips_w_Overcrowding and Average_Peak_Load_Factor.
- Cell data starts Nov 2025 — no Sep/Oct, so the start-of-term surge is not observed.
- Weather from two stations: hourly from Vancouver Harbour, daily wet-day flags from YVR.
